TITLE

ì

PRODUCTION OF LUBRICATIVE SINTERED METAL BODY

BSTRACT :

PURPOSE: To produce the captioned metal body of superior lubricity by mixing the MoS_2 powder and granules covered with Cu into sintered meral material, molding the mixture

and sintering the same in a hydrogen atmosphere.

CONSTITUTION: MoS $_2$ powder and granules are coated with Cu of 10-30%. The Cu-coated MoS₂ powder and granules are compounded and mixed at about 2-7% in sintered metal material and the mixture is molded. The molding is sintered in a hydrogen atmosphere at the temperature around 800°C in the case of Cu-base sintered material and at around 1100°C in the case of Fe-base sintered material. After sintering treatment, MoS₂ is suitably exposed and since there is no change of properties of MoS₂ to MoO₃, the sintered metal body of superior lubricity may be obtained.
